

in a group being separated from an adjacent message in that group by a second period of time, said receiver comprising:

control means arranged to control operation of the receiver based on the intermittent sequence as updated by received ones of the transmitted intermittent sequence of messages including control information indicative of a variation in said sequence of intermittent messages;

a clock for providing a time reference to said control means; and

receiver and synchronization means, responsive when enabled, to a received message to indicate to said control means reception of said message,

wherein said control means is arranged to enable power conservation within the receiver for a period of time based on the intermittent sequence, and any variation thereof, said period of time being such that power conservation is disabled to receive a message in each of the groups of the sequence.--

REMARKS

Entry of the above amendments prior to examination is respectfully requested.
